

Quant Prime — Research Tier Email Funnel (v3 — FINAL DATA)

Sender: Sean from Quant Prime · hello@quantprime.uk **Reply-to:** monitored inbox, not noreply@ — replies are the strongest deliverability signal there is **Send time:** 7–8am UK (briefings go at 10pm — keep separation)

Placeholders: {{FIRST_NAME}} · {{GUIDE_LINK}} · {{CHECKOUT_LINK}} · {{DISCORD_LINK}} · {{CALC_LINK}} · {{UNSUBSCRIBE}}

Figures used: Meridian, EURUSD, 3M, Feb–Aug 2026, 279 trades, 68.46% win rate, PF 1.995, max drawdown 11.59%, commission included, in-sample. **Deliberately not used:** the +48.66% return figure, and any Meridian/Recoil side-by-side. See notes at the end.

Email 1 — Welcome (immediate)

Subject A: You're in. Here's the Manifesto. **Subject B:** The Manifesto (+ what's coming)
Preview: Ten minutes. The second half is where it earns the time.

{{FIRST_NAME}},

Here it is.

CTA button: Read the Manifesto → {{GUIDE_LINK}}

Ten minutes, one sitting. The second half is where it earns the time.

Then four more emails over the next five days:

Day 1 — Where my own system stops working, with the timeframe and the reason. Not a teaser.

Day 2 — A backtest of mine that hit an 81.5% win rate and lost money anyway, and the ten-minute check that would have caught it.

Day 3 — Every trader has a subscription they've forgotten they're paying for. Why this one either won't be, or you should cancel it.

Day 5 — Last one, then I'm out of your inbox.

No motivational quotes, no screenshots of somebody's account. Working notes.

— Sean Quant Prime

P.S. If this landed in Promotions, drag it across. The Day 1 email is the one worth having and it'll land wherever this one did.

Email 2 — Day 1 (failure mode / trust)

Subject A: It stops working on the 15-minute chart **Subject B:** The half of the backtest nobody publishes **Preview:** Where my system fails, in writing.

Meridian is a reversal engine. A prior swing level gets swept, which sets directional bias. Price then taps a vortex level, which confirms the entry. Two conditions. No discretion, no interpretation, no "it looked good."

Backtested on EURUSD, 3-minute chart, February to August 2026:

279 trades 68.46% win rate Profit factor 1.995 Max drawdown 11.59% Commission included in every figure

Now the part that doesn't usually make it into the email.

On the 15-minute chart and above, it goes unprofitable.

Not slightly worse. Unprofitable.

The reason is structural rather than a bug. The engine needs a certain number of bars of price structure inside each phase before a signal resolves. On higher timeframes those bars don't exist, so it's being asked a question it has no mechanism to answer. I could hide that by only ever showing you the 3M chart. Most people would.

Three more things you should know before you take that 1.995 seriously:

It's **in-sample** — the system was developed on this data. Out-of-sample results will be worse. They always are.

It's **one pair**. EURUSD only. I haven't published multi-pair results because I don't have multi-pair results.

That **11.59% drawdown is the real number**. At some point in those six months the account was down 11.59% from its high and the correct action was to keep taking signals. Most people don't. That's not a system problem, it's the part the system can't do for you.

A strategy with no documented failure mode hasn't been tested. It's been marketed. If someone shows you something that works on every pair, every timeframe, every session, you're looking at a curve fit and a sales page, usually at the same time.

Everything in the Quant Prime library ships with its boundaries stated first. That's the whole product, really.

— Sean

P.S. Tomorrow's is the one I'd actually read — a backtest of mine with an 81.5% win rate that still lost money, and the two-minute check that catches it.

Backtested results, EURUSD 3M, Feb–Aug 2026, in-sample, commission included.

Hypothetical performance — no live capital produced these figures. Past performance does not indicate future results. Educational content only, not financial advice. Trading carries risk of loss.

Email 3 — Day 2 (value + micro-commitment)

Subject A: 81.5% win rate. Still lost money. **Subject B:** 1,398 trades, all measuring the wrong thing **Preview:** The number every course sells you on is the one that lies.

Earlier this year I hand-tested a volatility fade setup on the 1-minute chart. Seventeen hours of clicking. 1,398 trades. 81.5% win rate.

It was unprofitable.

The average winner came in under 5 pips. At \$0.07 commission per order — \$0.14 the round trip — friction was eating roughly 3 pips of every single trade. An 81.5% win rate on a 4-pip edge against 3 pips of cost isn't an edge. It's a rounding error you're paying a broker to generate on your behalf.

The lesson isn't "don't scalp." It's that **win rate is the least useful number in a backtest**, and it happens to be the one every course on the internet sells you on, because it's the one that looks best in a screenshot.

Three that matter more:

Profit factor. Gross profit divided by gross loss. Under about 1.2 and you've no margin left for slippage or spread widening, which means the backtest is fiction.

Average win in pips against your all-in cost per round trip. Under 3:1 and you are, functionally, trading for your broker. This is the one that killed the 81.5%.

Trade count. Forty trades proves nothing. 1,398 proved my system was broken, which was worth all seventeen hours.

Run the first two on whatever you're trading right now. I've put the arithmetic on a single page — your numbers in, a straight answer out about whether your edge survives contact with costs.

CTA button: `Run the cost-drag check (free) → {{CALC_LINK}}`

Two minutes. If it comes back clean, ignore me and carry on. If it doesn't, you've just saved yourself a year of paying tuition to a spread.

— Sean

P.S. That test is the reason Recoil now runs a cost-aware backtester rather than a signal counter. The full write-up is one of the ten papers in the Research library — but do the free check first. It's the part that matters and it costs nothing.

Email 4 — Day 3 (objections → buy)

Subject A: Another £8 you'll forget you're paying **Subject B:** Three objections, answered properly **Preview:** Including the one about why it's this cheap.

Three things people say when they get to this email. All three are reasonable, so let's do them properly.

"It's too good to be true."

Good instinct — keep it. But look at what I actually published on Monday: a system that goes unprofitable two timeframes up, tested in-sample on a single pair, with an 11.59% drawdown I didn't round down. If I were fabricating, I'd have fabricated something better than a profit factor of 1.995. The unimpressive parts are the evidence.

"I've been burned before."

Almost certainly by someone selling certainty. The distinction worth drawing: Quant Prime measures things. It doesn't predict them. Every instrument tells you what conditions are present right now and what the system does under those conditions. Nothing in the library forecasts where price is going, because nothing can, and anyone who tells you otherwise is describing a product that doesn't exist.

"Why is it only £8?"

Because it's the first rung, and I'd rather you climbed it than stared at it. £8 is deliberately low enough to be a non-decision and high enough to filter out people who'll never open the email. If the research is good you'll eventually want the instruments, and those are the tiers where the business actually is. If it isn't good, you've lost £8 and you'll tell me so.

Here's what arrives, and how often — because the thing that stops a subscription being forgotten is something showing up.

Every weekday, 10pm UK — the daily briefing. What moved, why it mattered, what's set up for tomorrow. Twenty-two a month. If you stop opening them, cancel. That's your test and I'd rather you ran it.

Every Friday — weekly insights. Structural read on the week: what formed, what's forming.

Ten research papers, from day one — regime detection, session timing, volatility filters, drawdown control, position sizing, correlation, news impact, backtest methodology, risk management, system building. Written the way a fund writes internal research: methods, figures, and the caveats left in.

The members' channels. Not the free ones. Fewer people, considerably better conversation.

Full marketplace access — the whole instrument menu, so you can see what the higher tiers are built out of before you ever consider paying for one.

£8 a month is £96 a year. One avoidable losing trade costs most people more than that. The 1,398-trade test I sent yesterday cost me a great deal more than £96 to learn, and the papers are the version where you don't pay that tuition to the market.

CTA button: Start for £8 → {{CHECKOUT_LINK}}

7-day money-back guarantee. Cancel in two clicks, any time.

— Sean

P.S. If the papers don't teach you something you didn't already know, reply inside seven days and I'll refund the £8 and you keep everything you've read. Around 230 traders are already in the community; the difference between the free channels and the members' ones is entirely that £8 filter.

Email 5 — Day 5 (final)

Subject A: Last one from me **Subject B:** Thirty days from now **Preview:** Then I'm out of your inbox.

Last email in the sequence. I'll keep it short, because the argument isn't complicated and it isn't a discount.

Thirty days from now, those thirty days will have gone either way. You'll either have read ten research papers, had twenty-two daily briefings land at 10pm, and understand considerably more about why your system does what it does — or you'll be exactly where you are today. Thirty days is short enough to lose without noticing. That's most of how it happens.

£8. Seven-day guarantee. Cancel in two clicks.

CTA button: Start for £8 → {{CHECKOUT_LINK}}

7-day money-back guarantee.

If you're not ready, [join the free Discord](#) instead — around 230 traders, charts posted daily, no pitch.

And either way: run the cost-drag check from Tuesday on whatever you're trading now. Almost nobody does, and it's the quickest way to find out whether you're running a system or a habit.

I'm still building this. I'm not pretending to be finished, and I'm not pretending to be something I'm not. If that's the kind of thing you want to be near, the door's open at either price.

Good luck out there.

— Sean Quant Prime

P.S. If you've read all five and decided this isn't for you, that's a completely reasonable conclusion and I'd rather you reached it now than after paying me. Unsubscribe below, no hard feelings.

Compliance footer (every email)

Quant Prime provides educational content and analytical software. Nothing here is financial advice or a recommendation to trade. Trading carries risk of loss. Performance figures shown are hypothetical backtested results, not live trading returns, and past performance does not indicate future results.

Decisions worth knowing

The +48.66% return is not used anywhere. Return is a function of position sizing, not of the system. Without stated risk-per-trade it's unfalsifiable, it's the first number a sceptic attacks, and it sits closest to the "never promise specific returns" line in the compliance notes. PF 1.995 with an 11.59% drawdown carries the same weight and survives scrutiny.

Meridian and Recoil are never compared. Recoil's 1.57% max drawdown against Meridian's 11.59% almost certainly reflects different position sizing rather than different risk profiles. Put side by side, that comparison misleads. If you want them compared, re-run at matched risk per trade.

Email 2 volunteers three weaknesses — in-sample, single pair, real drawdown. That's the conversion mechanism, not a hedge. Volunteering the weak points is expensive to fake, which is exactly why it's believed.

Email 3 never mentions Meridian's numbers. Spending an email arguing that headline win rates mislead, then flexing a win rate, would undo it.

Still needed

- `{{CALC_LINK}}` — the cost-drag check page. One input row (avg win in pips, commission, spread, trade count), one verdict. Load-bearing: it's the CTR driver in Email 3 and gets called back in 4 and 5.
- Behavioural segment: anyone who clicks the check should get a different Email 4 opening — "you ran the check on Tuesday, so you already know..."
- Out-of-sample Meridian results, when you have them. That's the single biggest upgrade available to this sequence.
